Developmentally regulated
                                                                                                                                                                                                                                                                                                                                   Proc. Natl. Acad. Sci. U.S.A. 87:7000-7004(1990).
-!- FUNCTION: May be involved in the regulation of specific developmental processes in the CNS.
-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -:- SIMILARITY: Contains 1 eukaryotic-type carbonic anhydrase domain.
-:- SIMILARITY: Contains 2 protein-tyrosine phosphatase domains.
-:- SIMILARITY: Contains 1 fibronectin type III domain.
-:- CAUTION: Called RPTPAse beta in Ref.2 and Ref.4.
                                                                                                                                                                                                                                                                                                       family of receptor-linked protein-tyrosine-phosphatases expressed in
                                                                                                                                     human receptor-like protein

C. FUNCTION: The JUNK-interacting protein (JIP) group of scaffold proteins selectively mediates JUNK signaling by aggregating specific components of the MaPK cascade to form a functional JUNK signaling module. May function as a regulator of vesicle transport, through interations with the JUNK-signaling components and motor proteins.

C. SUBUNIT: Forms homo- or heterooligomeric complexes. The central region of MapkBip1. Binds specific components of the JUNK signaling pathway namelly Mapk8, Mapk9 and Mapk10 to the N-terminal region, Mapk24 and Mapk27 to the central region and map3k11 to the C-terminal region and map3k11 to the C-terminal region and map3k11 to the C-terminal region. Binds the TPR motif-containing C-terminal of kinesin light chain, pre-assembled MapkBip1 scaffolding complexes subcellular location.

C. SUBCELULAR LOCATION: Cytoplasmic; localised in the soma and growth cones of differentiated neurites and the Golgi and vesicles of the early secretory compartment of epithelial cells.
